

GOOGLE ANALYTICS 4

Implementation & Reporting Documentation

Project: UrbanCart — GTM & GA4 Practice

Prepared for: Analytics & Marketing Team

Website: pranaygavaskar.github.io/urban-cart/

Date: September 10, 2026

NOTICE — DEMO / PRACTICE REPORT

This is not a real client engagement or a live commercial website. “UrbanCart” is a personal demo/practice site (hosted at pranaygavaskar.github.io/urban-cart/) built solely to learn and demonstrate the Google Analytics 4 (GTM & GA4) setup and reporting workflow. All account names, business details, traffic, and analytics data shown in this document were generated during self-testing and are used only to illustrate how a GA4 implementation report is created — they do not represent any actual business, client, or customer.

Table of Contents

1. Executive Summary
2. GA4 Account & Property Setup
3. Data Stream & Tag Installation
4. Real-Time Data Verification
5. Traffic Acquisition Analysis
6. Engagement & Audience Analysis
7. Lifetime Value & Long-Term Engagement
8. Geographic Analysis
9. Technology Analysis
10. Key Findings & Recommendations

1. Executive Summary

This report documents the end-to-end implementation of Google Analytics 4 (GA4) for the UrbanCart demo e-commerce website, along with an analysis of the data collected during the initial testing and validation period. The objective of this exercise was to configure a GA4 property from scratch, verify that tracking was firing correctly using the Google tag, and validate data capture through GA4's Real-Time and standard reporting views.

The report walks through the step-by-step account and property setup process, then presents the resulting analytics data — covering real-time activity, traffic acquisition, engagement, lifetime value, geography, and technology.

1.1 Methodology

All configuration steps were performed directly in the Google Analytics 4 admin console, using the account-creation wizard, the data-stream setup flow, and manual gtag.js installation. Data was then reviewed across GA4's built-in Real-Time, Reports snapshot, Acquisition, Engagement, Retention, Lifetime Value, Demographics, and Tech details reports. Every figure and metric quoted in this document was captured directly from these GA4 reports via screenshots taken between September 10, 2026 testing sessions, covering trailing windows of 5 minutes, 7 days, 28 days, 42 days, and 120 days depending on the report.

Metric	Value	Observation
Property Name	clients	GA4 property created under account 'urban fashion cart'
Website Tracked	pranaygavaskar.github.io/urban-cart/	Enhanced Measurement enabled
Total Users (28 days)	9	8 Direct, 1 Referral (first-touch)
Total Sessions (28 days)	14	64.3% engagement rate
Total Events (28 days)	140	page_view, scroll, user_engagement, session_start, first_visit
Total Page Views (28 days)	35	Across 2 tracked page paths

2. GA4 Account & Property Setup

The GA4 environment was configured through the Google Analytics account-creation wizard. Each stage below captures the exact configuration applied for the UrbanCart project.

STEP 1

Create the Analytics Account

The setup begins by creating a new Google Analytics account named “urban fashion cart.” An account acts as the top-level container that can hold one or more properties (measurement IDs). Default data-sharing settings were reviewed and left at Google’s recommended configuration.

1 Account creation 2 Property creation 3 Business details 4 Business objectives 5 Data collection

Create an account

Create an Analytics account to collect and organize data. Accounts can access multiple data sources, using one or more measurement IDs.

Account details

Account name (Required)
Accounts can contain more than one measurement ID.

urban fashion cart

Google Analytics is a business tool. Use it exclusively for purposes related to your trade, business, craft, or profession.

Account Data Sharing Settings

Google processes your Google Analytics data only as required to [maintain and protect](#) the Google Analytics service, as set out in the [Google Ads Data Processing Terms](#). The data sharing settings below allow you to customize whether the data that you collect in Google Analytics may also be shared with Google for additional purposes.

Figure 1 — Account creation screen with account name 'urban fashion cart'

STEP 2

Create the Property

A GA4 property named “clients” was created inside the account to hold all measurement data for the UrbanCart website. The reporting time zone was set to India (GMT+05:30) and the currency to Indian Rupee (₹) to match the target market.

Analytics

[Back](#)

1 Account creation 2 Property creation 3 Business details 4 Business objectives

Create a property

To measure your web and app data, create a Google Analytics 4 property. Each property you create holds all your measurement data for any selection of websites and apps you choose.

Property details

Property name (Required)
clients

Reporting time zone
India (GMT+05:30) India Time

Currency
Indian Rupee (₹)

You can edit these property details later in Admin

Figure 2 — Property creation with time zone and currency configuration

STEP 3

Describe the Business

Business details were supplied to help Google Analytics tailor its recommendations. The Industry category was set to Shopping and the Business size to Small (1–10 employees), reflecting the profile of a small e-commerce operation.

Describe your business

Help us better understand your business by answering the following.
Your input helps improve Google Analytics.

Business details

Industry category (Required)

Shopping ▾

Business size (Required)

☒ Small - 1 to 10 employees

☐ Medium - 11 to 100 employees

☐ Large - 101 to 500 employees

☐ Very Large - 501+ employees

Figure 3 — Business details: Shopping industry, Small business size

STEP 4

Choose Business Objectives

Two business objectives were selected to focus GA4's default reports and recommendations: Generate leads and Understand web and/or app traffic. These map directly to the goals of measuring visitor behaviour and potential conversion actions on the UrbanCart site.

Choose your business objectives

To get recommendations personalized for your business,
select the objective most relevant to you. You can select
more than one objective, but a maximum of two is recommended.

Generate leads  Measure actions that indicate potential customers, such as completing contact form or requesting a quote ☒

Drive sales  Analyze and optimize sales and any financial transactions on your website or app ☐

Understand web and/or app traffic  Measure your website or app visitors and the channels that drive their visits ☒

View user engagement & retention  Learn how people explore the products or services on your website or app ☐

Figure 4 — Business objectives: Generate leads + Understand web/app traffic

3. Data Stream & Tag Installation

With the property created, a web data stream was configured to begin collecting data from the live UrbanCart site, followed by manual installation of the Google tag.

STEP 5

Set Up the Web Data Stream

A web stream was created for <https://pranaygavaskar.github.io/urban-cart/>, named “my website.” Enhanced Measurement was left enabled, which automatically captures page views, scrolls, outbound clicks, and four additional interaction event types without extra code.

The screenshot shows the 'Set up data stream' interface in Google Analytics. At the top right is a 'Create & continue' button. The main section is titled 'Set up your web stream'. It contains two input fields: 'Website URL' with a dropdown set to 'https://' and a text field containing 'pranaygavaskar.github.io/urban-cart/', and 'Stream name' with a text field containing 'my website'. Below these is the 'Enhanced measurement' section, which has a blue checkmark icon and a toggle switch that is turned on. The text below the toggle reads: 'Automatically measure interactions and content on your sites in addition to standard page view measurement. Data from on-page elements such as links and embedded videos may be collected with relevant events. You must ensure that no personally-identifiable information will be sent to Google. [Learn more](#)'. At the bottom, the 'Measuring' section shows four icons: a blue eye for 'Page views', a green plus for 'Scrolls', a blue shield for 'Outbound clicks', and a '+ 4 more' link. A gear icon is also present.

Figure 5 — Web stream configuration with Enhanced Measurement enabled

STEP 6

Install the Google Tag

The Google tag (gtag.js) was installed manually by copying the generated snippet — referencing measurement ID G-FOLD9TFKP2 — into the <head> section of every page on the UrbanCart site. Manual installation was chosen over Google Tag Manager for this lightweight, single-tag implementation.

Figure 6 — Manual Google tag snippet for measurement ID G-FOLD9TFKP2

4. Real-Time Data Verification

Immediately after installing the tag, the GA4 Real-Time report was used to confirm that events were being received from the live site. This is the standard sanity check before relying on standard (processed) reports.

4.1 Real-Time Overview

The Realtime overview confirmed live traffic: 6 active users in the last 30 minutes and 2 active users in the last 5 minutes, with a visible spike in per-minute activity during the testing window.

Figure 7 — Realtime overview showing active users per minute

4.2 Real-Time Detail Cards

Supporting real-time cards showed all 6 active users attributed to the 'All Users' audience, 10 page views recorded on the UrbanCart page, and page_view as the leading event (10 events, 31.25% of total). No first-user source or key events had been configured/triggered yet at this stage.

Figure 8 — Realtime detail: active users by audience, views by page, and event count

4.3 Real-Time Pages

The Realtime pages report broke activity down by exact page path: /urban-cart/ recorded 6 active users and 6 views, while /urban-cart/index.html recorded 2 active users and 4 views — confirming both the root path and the index file were being tracked correctly.

Figure 9 — Realtime pages by path and screen class

5. Traffic Acquisition Analysis

Once sufficient time had passed for GA4 to process standard reports, the Reports snapshot and Traffic acquisition reports were reviewed to understand where users were coming from over the last 7 and 28 days.

5.1 Reports Snapshot (Last 7 Days)

Over the trailing 7-day window the property recorded 2 active users (+100% vs. previous period), 13 events (+62.5%), and 3 views (+50%), with 8 active users in the last 30 minutes — most of the recent activity concentrated in Karjat (5 active users).

Figure 10 — Reports snapshot: 7-day trend and active users by city

5.2 Users by First-User Channel Group

Of the 9 total users recorded, 8 (88.9%) arrived via Direct traffic and 1 (11.1%) via Referral. Interestingly, the single Referral user showed much higher engagement — 53 seconds average engagement time and 5.00 engaged sessions per user — versus 17 seconds and 0.50 for Direct users.

		Total users	New users	Returning users	Average engagement time per active user	Engaged sessions per active user	Event count
		100% of total	100% of total	100% of total	Avg 0%	Avg 0%	100% of total
☒	Total	9	9	2	21s	1.00	14C
☒	1 Direct	8 (88.89%)	8 (88.89%)	1 (50%)	17s	0.50	83 (59.29%)
☒	2 Referral	1 (11.11%)	1 (11.11%)	1 (50%)	53s	5.00	57 (40.71%)

Figure 11 — Total, new, and returning users by first-user channel group

5.3 Session-Level Channel Breakdown (Last 28 Days)

At the session level, Direct accounted for 9 of 14 sessions (64.3%) while Referral drove 5 sessions (35.7%). Notably, Referral sessions converted to a 100% engagement rate versus 44.4% for Direct, and generated a higher average engagement time per session, with Referral driving more events per session overall.

Figure 12 — Traffic acquisition: sessions and engagement by channel, Aug 13 – Sep 9, 2026

6. Engagement & Audience Analysis

6.1 Engagement Overview

Average engagement time per active user stood at 21 seconds with 1 engaged session per active user over the last 28 days, tracking below the Shopping & Retailers peer median band for most of the period, with a brief spike above it in late August.

Figure 13 — Engagement overview vs. Shopping & Retailers peer benchmark

6.2 Views and Event Volume

Total views reached 35 and total events reached 140 over 28 days. The event mix was led by page_view (35), followed by a custom 'client 1' event (32), scroll (24), user_engagement (24), session_start (14), first_visit (9), and a 'new event' (2) — indicating Enhanced Measurement and a custom event were both firing correctly.

Figure 14 — Views and Event count trend with full event breakdown

6.3 Page Views and Multi-Period User Activity

The single tracked page, 'UrbanCart — GTM & GA4 Practice,' accounted for all 35 views. The user-activity chart confirmed 9 users over the trailing 30 days, 2 over the trailing 7 days, and 0 in the last 24 hours at the time of reporting.

Figure 15 — Views by page title and 30/7/1-day user activity overlay

6.4 User Stickiness

The stickiness ratio (DAU/MAU and DAU/WAU) was largely flat at 0% for most of the period, with a WAU/MAU ratio spike to 22.2% in the most recent week, reflecting the concentrated, short testing bursts rather than sustained daily usage — expected for a demo property still in validation.

Figure 16 — User stickiness: DAU/MAU, DAU/WAU, WAU/MAU ratios

6.5 Page Path Performance

Comparing the two tracked paths: `/urban-cart/` generated the majority of views (19, or 54.3%) with all 9 active users, but a low 6-second average engagement time. `/urban-cart/index.html` generated fewer views (16, or 45.7%) but a much higher 32-second average engagement time — suggesting users spent more time once landing on the index file directly.

Total urban-cart/ urban-cart/index.html		Plot rows Search... Rows per page: 10 1-2 of 2	
Page path and screen class +		Views Active users Views per active user Average engagement time per active user Event count All events Key events All events	
Total		35 9 3.89 21s 140 0.00	
1 urban-cart/		19 (54.29%) 9 (100%) 2.11 6s 90 (64.29%) 0.00	
2 urban-cart/index.html		16 (45.71%) 4 (44.44%) 4.00 32s 50 (35.71%) 0.00	

Figure 17 — Views, active users, and engagement time by page path

6.6 Event Volume Over Time

The event-count-by-name trend shows three distinct testing bursts (around Aug 24-26, Aug 31, and Sep 7-9), consistent with iterative implementation and QA sessions rather than continuous organic traffic.

Figure 18 — Event count by event name over time (Aug 13 – Sep 9)

6.7 New vs. Returning Users & Retention

Of all users, 9 were new and 2 were returning. User retention by cohort peaked sharply (~57%) for the cohort acquired around Aug 24–26 before falling off, typical of a small, short-lived test cohort rather than an ongoing retention pattern.

Figure 19 — New vs. returning users and retention by cohort

6.8 Cohort Engagement & Overall Retention

User engagement by cohort mirrored the same late-August spike (~50 seconds), and the overall User Retention curve — 100% on Day 0 falling toward single digits by Day 10, with two brief rebounds around Day 10 and Day 17 — confirms the same small-cohort, burst-testing pattern seen across the other engagement views.

Figure 20 — User engagement by cohort and 42-day user retention curve

7. Lifetime Value & Long-Term Engagement

The Lifetime Value (LTV) report was reviewed to understand how user engagement evolves over longer windows — 42 days for engagement duration and 120 days for average lifetime value — beyond the 28-day windows used earlier in this report.

Figure 21 — User engagement over 42 days and Average 120-day value

User engagement over the trailing 42 days shows a single sharp spike near Day 3, with two much smaller bumps around Day 10 and Day 17, then a flat line for the remainder of the period — consistent with the short, isolated testing bursts already identified. The Average 120-day value chart is flat at zero throughout, which is expected: no monetary or revenue-generating events (e.g., purchase, transaction) have been configured in GA4 yet, so LTV cannot be calculated in dollar or rupee terms until e-commerce tracking is implemented.

8. Geographic Analysis

The City dimension was reviewed to understand where the property's active users are physically located, which helps validate tracking (are the expected testers showing up?) and can inform future localisation decisions.

Plot rows

Search...

Rows per page: 10

1-4 of 4

	City		Active users	New users	Engaged sessions	Engagement rate	Engaged sessions per active user	Average engagement time per active user	Event count All events
	Total		9	9	9	64.29%	1.00	21s	140
			100% of total	100% of total	100% of total	Avg 0%	Avg 0%	Avg 0%	100% of total
	1 Karjat		4 (44.44%)	4 (44.44%)	9 (100%)	100%	2.25	47s	115 (82.14%)
	2 (not set)		2 (22.22%)	2 (22.22%)	0 (0%)	0%	0.00	0s	10 (7.14%)
	3 London		2 (22.22%)	2 (22.22%)	0 (0%)	0%	0.00	0s	10 (7.14%)
	4 Andorra la Vella		1 (11.11%)	1 (11.11%)	0 (0%)	0%	0.00	0s	5 (3.57%)

Figure 22 — Active users, engagement, and events by city

Karjat was the single largest source of activity: 4 active users (44.4%), all 9 engaged sessions, a 100% engagement rate, and 82.1% of total events (115 of 140) — indicating this is almost certainly the primary tester/implementer location. A further 22.2% of users came through with city unresolved ('not set'), while London and Andorra la Vella each contributed a smaller share of users but recorded 0% engagement rate and 0-

second average engagement time, suggesting these sessions were brief, automated, or non-interactive rather than genuine engaged sessions.

9. Technology Analysis

GA4's Tech details reports were used to profile the browsers, devices, operating systems, and screen resolutions of visitors to UrbanCart, which is essential for prioritising QA and responsive-design effort.

9.1 Browser

Chrome was the dominant browser, accounting for 8 of 9 active users (88.9%) and 73.6% of all events, but with a relatively low 7-second average engagement time and a 58.3% engagement rate. Samsung Internet, used by only 1 user (11.1%), showed dramatically higher engagement — a 100% engagement rate and 2 minutes 7 seconds average engagement time — pointing to a single highly-engaged mobile session.

Plot rows		Search...					Rows per page: 10	1-2 of 2	
	Browser		Active users	New users	Engaged sessions	Engagement rate	Engaged sessions per active user	Average engagement time per active user	Event count All events
	Total		9	9	9	64.29%	1.00	21s	140
			100% of total	100% of total	100% of total	Avg 0%	Avg 0%	Avg 0%	100% of total
	1 Chrome		8 (88.89%)	8 (88.89%)	7 (77.78%)	58.33%	0.88	7s	103 (73.57%)
	2 Samsung Internet		1 (11.11%)	1 (11.11%)	2 (22.22%)	100%	2.00	2m 07s	37 (26.43%)

Figure 23 — Active users, engagement, and events by browser

9.2 Device Category

Desktop accounted for the majority of activity — 7 of 9 active users (77.8%) and 98 of 140 events — but with a short 9-second average engagement time. Mobile, used by 2 users (22.2%), again showed outsized engagement quality: a 66.7% engagement rate and 1 minute 3 seconds average engagement time per active user, more than six times longer than desktop.

Figure 24 — Device category trend and breakdown: desktop vs. mobile

9.3 Operating System

The operating system split mirrors the device-category split almost exactly: Windows accounts for 7 active users (77.8%) — consistent with the desktop figures above — and Android accounts for 2 active users (22.2%), consistent with the mobile figures. This confirms the desktop testers were on Windows machines and the mobile testers were on Android devices, with Android sessions again showing the longer 1m 03s average engagement time.

Figure 25 — Operating system trend and breakdown: Windows vs. Android

9.4 Screen Resolution

Four distinct screen resolutions were recorded. 1920x1080 (full HD desktop) was most common at 44.4% of users but recorded 0% engagement rate and 0-second engagement time — likely quick QA checks rather than active browsing. 1536x864 (a common scaled laptop resolution) drove the most substantial engagement: 100% engagement rate, 21-second average engagement time, and 55%+ of total events. The two remaining resolutions, 1024x1024 and 412x912 (a typical mobile portrait size), each represented a single user, with 412x912 again standing out for high engagement (100% rate, 2m 07s average engagement time) — the same mobile session identified in the browser and OS breakdowns.

Figure 26 — Active users, engagement, and events by screen resolution

10. Key Findings & Recommendations

10.1 Key Findings

- GA4 was successfully implemented end-to-end for UrbanCart: account, property, data stream, and Google tag are all live and verified via Real-Time reporting.
- Enhanced Measurement is active and correctly capturing `page_view`, `scroll`, and `user_engagement` events alongside a custom 'client 1' event.
- Traffic to date is dominated by Direct visits (88.9% of users, 64.3% of sessions), with only a single Referral source; there is no Organic Search, Paid, or Social channel data yet.
- Referral traffic, while low in volume, converts to markedly higher engagement (100% engagement rate, 53s avg. engagement time) compared to Direct traffic.
- Activity is concentrated in short testing bursts (late August and early September) rather than continuous traffic, consistent with an implementation/QA phase.
- The `/urban-cart/index.html` path shows stronger per-user engagement time (32s) than the `/urban-cart/` root path (6s), worth investigating for landing-page design differences.
- Average Lifetime Value is flat at ₹0 because no revenue/transaction events are currently configured in GA4.
- Karjat is the dominant geographic source of engaged activity (82.1% of events, 100% engagement rate); London and Andorra la Vella sessions show 0% engagement and likely represent incidental or non-genuine visits.
- A consistent pattern recurs across Browser, Device, OS, and Screen Resolution: the single mobile/Android/Samsung Internet session is disproportionately more engaged than the majority Chrome/Windows/Desktop traffic.

10.2 Recommendations

- Begin driving real organic and paid traffic (SEO, social, campaigns) to build a fuller picture of channel performance beyond Direct and Referral.
- Configure Key Events (conversions) in GA4 — e.g., add-to-cart, checkout, or lead-form submission — since no key events have been recorded to date.
- Consider migrating the manual gtag.js snippet to Google Tag Manager if additional tags (Ads, Meta Pixel, etc.) will be added in the future, for centralized tag governance.
- Extend the observation window beyond 28/120 days once live traffic begins, to get statistically meaningful retention, stickiness, and LTV metrics.
- Investigate the engagement-time gap between the root path and `index.html` to identify any redirect, caching, or content differences affecting user experience.
- Prioritise mobile UX given the outsized engagement seen on the one mobile session, and verify London/Andorra la Vella sessions via country-level and bot-filtering checks.

Appendix — Glossary of GA4 Terms

Brief definitions of the key GA4 metrics referenced throughout this report, for readers less familiar with Google Analytics 4 terminology.

Active user	A user who had an engaged session, or their first visit / first open, during the reporting period.
Engaged session	A session lasting 10+ seconds, with a key event, or with 2+ page/screen views.
Engagement rate	The percentage of sessions that were engaged sessions (Engaged sessions ÷ Sessions).
Enhanced Measurement	A GA4 feature that automatically tracks common interactions (page views, scrolls, outbound clicks, etc.) without extra code.
Key event	An event marked as important for measuring business objectives (formerly called a 'conversion').
Lifetime Value (LTV)	The predicted or observed net revenue attributable to a user's entire relationship with the app/website.
First-user channel group	The marketing channel that first brought a user to the site (e.g., Direct, Referral, Organic Search).
Stickiness (DAU/MAU)	The ratio of daily to monthly (or weekly) active users, indicating how frequently users return.

Reminder: UrbanCart is a demo/practice website, not a real client. This report was produced to learn and demonstrate the GA4 implementation-and-reporting process.
